PROFILE

Backend engineer with nearly three years of experience building and running services and APIs in production, first in Node.js / NestJS, then in Python: PostgreSQL, Docker, query and latency optimization, and personal data handled under encryption and access controls. I have also integrated AI features into these backends (LLM agents, retrieval over a live database, MCP servers), including token-cost tracking and iteration on real production failures. Background in biomedical research (MSc). French (native), English (C1).

TECHNICAL SKILLS

Backend: Python, FastAPI, Django, REST API design, authentication, unit and integration testing, Node.js / NestJS (TypeScript)

Data: PostgreSQL (data modeling, migrations, indexing, query optimization), SQL, pgvector

Infrastructure & tooling: Docker, GCP (Cloud Run, GKE, Vertex AI), Git, GitLab, Linux

Applied AI: LLM integration in backend services, multi-step agents (tool use), RAG, MCP servers, LangChain, Vertex AI SDK (Gemini), token & cost monitoring

AI-assisted coding: Claude Code, GitHub Copilot — generated code reviewed and tested before merging

Data protection: Personal data (PII) encryption, access controls, authentication

EXPERIENCE

Python / GenAI Engineer | Alinéa (retail group), Aubagne, France | Oct 2024 – Apr 2026

Transformation team — internal services and tools for business teams, from the initial need through to production.

- Designed and built Python REST APIs (FastAPI) and Node.js / NestJS services exposing internal services to business applications, containerized with Docker and running on Cloud Run and GKE.
- Cut end-to-end query latency from 37 ms to 6 ms (~6x faster) by reworking the data access path.
- Built semantic product search over a live PostgreSQL catalog (3,500+ products × 224 attributes) with pgvector, owning the data model and the serialization and metadata strategy. Deployed in store and used daily by 10 sales associates.
- Handled personal data (PII) with encryption and access controls.
- Integrated LLM features into backend services: multi-step agents that chain tools and decide the next step from intermediate results, MCP servers exposing internal tools, prompts iterated on real production failures, token cost tracked per call.
- Built an email-triggered processing pipeline for the logistics team: incoming disputes are classified automatically and consolidated in a Looker Studio dashboard showing which carriers generate the most disputes.
- Built a daily workflow that analyses customer-service call transcripts and surfaces the urgent cases to call back first.

Fullstack Developer | People In (HR SaaS), Avignon, France | Sept 2023 – Sept 2024

- Built end-to-end modules of a skills-based recruitment platform: documented REST APIs (NestJS / TypeScript), SQL data models and schema migrations.
- Wrote unit and integration test plans; debugged and fixed defects in development and production.
- Implemented authentication and encryption for sensitive candidate data. Agile team, code reviews.

SELECTED CLIENT PROJECT

Reservation platform for a B2B coffee-catering company — sole developer

- Django + PostgreSQL booking platform: invite-only authentication, atomic reservation transactions preventing double-booking under concurrent requests, HTMX / Alpine.js frontend.

EDUCATION

MSc Data & Artificial Intelligence — Nexa Digital School, France | 2024 – 2026

BSc Software Application Development — Nexa Digital School, France | 2023 – 2024

MSc Biomedical Sciences — Université Catholique de Louvain, Belgium | 2018 – 2020

Research focus: CRISPR-Cas9 and liver diseases; microbiology and lab work

LANGUAGES

French (native) · Comorian (native) · English (C1, professional working proficiency)
